Customer Reviews

I am writing a generic review of the Big Ideas Math curriculum and using the same review for all the books in the series... As a math tutor with over 25 years of experience, I have used and reviewed a lot of math texts. The Big Ideas Math curriculum is one of my least favorite. I've seen worse, but I've seen a lot better. It's too bad, because Larson and Boswell have written better texts, especially in the higher grades on more advanced concepts like trigonometry, pre-calculus, and calculus. Unfortunately, I cannot rave about the Big Ideas series. First off, it's a jumbled mess. By and large, most students coming into sixth grade are still not proficient at the trifecta of advanced arithmetic: fractions, decimals, and percents. As in foreign languages, becoming fluent at these three topics (and being able to effortlessly switch between them at a moment's notice) takes practice. By sixth grade, you hope that students will be able to use the terms "20 percent," "one fifth," "zero point two," "divide by five," "twenty hundredths" interchangeably. But it takes practice. At the end of most fifth-grade curricula, students have begun to understand the relationship between the various ways to skin a cat, so to speak. However, if they get to middle school and are thrown into the Big Ideas

series, there is no mention of the equivalency of fractions, decimals, and percents for many, many chapters. They start learning about exponents, orders of operations, and even distributing factors through an algebraic expression. Those are noble topics to be explored, but not if a student can't quickly tell me (without pencil or calculator) that 60 percent of 40 is 24.
