Peripheral Neuropathy: When The Numbness, Weakness And Pain Won't Stop (American Academy Of Neurology)
Synopsis

"Peripheral neuropathy affects 10 to 20 million people in the U.S, including ten per cent of all people who have diabetes. This condition has numerous causes, but can be associated with diseases such as HIV, alcoholism, and lupus, and may result from treatments for other medical conditions, such as cancer chemotherapy. Symptoms include pain, numbness, loss of balance, and tingling in the extremities. Although a widespread condition, most people don’t know about it, and when diagnosed find it difficult to obtain information. Peripheral Neuropathy, by Norman Latov, Professor of Neurology at the Weill Medical College of Cornell University, explains what we know about neuropathy, including its causes and manifestations, and what can be done to manage it. Topics covered include: The causes of peripheral neuropathy Drug therapy for the condition itself and for managing symptoms such as pain Interventional therapy Caring for your feet Personal accounts of people living with neuropathy Alternative medicines, and much more. This indispensable guide will help millions of people understand this condition so that they can take control of their lives and make informed decisions. In addition, it will be a useful resource for their families, caregivers, and health care providers."

Book Information

Series: American Academy of Neurology
Paperback: 134 pages

Shipping Weight: 8 ounces (View shipping rates and policies)
Average Customer Review: 4.3 out of 5 stars  See all reviews (77 customer reviews)
Best Sellers Rank: #49,998 in Books (See Top 100 in Books) #2 in Books > Health, Fitness & Dieting > Diseases & Physical Ailments > Rheumatic Diseases #45 in Books > Textbooks > Medicine & Health Sciences > Medicine > Clinical > Neurology #52 in Books > Health, Fitness & Dieting > Diseases & Physical Ailments > Nervous System

Customer Reviews

Beware of doctors who under treat and downplay the seriousness of Neuropathy. I have been struggling with the pain and tingling of feet and hands for several years. My primary doctor (of eight
years) just shrugged it off and said "It's probably just Neuropathy, nothing serious." He recommended Alive for the pain. On my last visit with my physician I again complained that my nerve, joint, and muscle pain was getting worse. I had trouble sleeping even four hours a night. I was having difficulty walking straight. As I spoke a sharp and intense pain struck the back of my left hand. I couldn't help but react. Then he said, with a smile: "Nobody should live past 75." (I'm 73.) After I fired him I found another primary care physician who prescribed a better medication for my pain. His initial examination was the most through I have ever experienced. He also referred me to a Neurologist. The Neurologist used a machine to administer jolts of electricity at various places on my feet, legs, arms, and hands. When he was finished he said that I had Moderate Polyneuropathy. He agreed with me that my former physician should have ordered this test, but he couldn't say anything about my prognosis. With this information I started a search on the Internet. I found that one of the medications my former doctor had me on had the possible side effect of Neuropathy. I conveyed this information to my new primary care physician. The next day his nurse telephoned to tell me that my blood pressure medication WAS the cause of my Neuropathy. My new doctor had reviewed all my lab tests and was certain of this finding. Naturally he changed my medication.
